

Air Maintenance Device

Sale Engineering Products now manufacture an air maintenance device, to be used in conjunction with sprinkler systems that are run off the works main air supply.

The air maintenance device allows the air to be regulated, which eliminates fluctuations in the pressure, and increases the reaction time in the event that a sprinkler head is activated.

The unit comes complete with:

- All galvanised fittings and pipe work
- Locking ball valves
- Norgren air regulator
- Glycerine filled pressure gauge
- Brass restrictor plate

Optional

- Inlet air filter with automatic drain
- Polypropylene mounting board
- Unistrut mounting frame
